Make inferences by pattern matching
(similar to term rewriting)

Each pattern on LHS of rule matches one statement

RHS gives new statement

Usage

```
; load knowledge and rules from scientific
publications
(load "data/cancer_biology/knowledge.scm")
(load "data/cancer_biology/rules.scm")

; add them to the engine
(ie:add-knowledge knowledge)
(ie:add-aliases compound_obj_aliases)
(ie:add-rules rules)

; ask the system whether a statement is true
(ie:is-true '(CAUSE (p15 cell-
proliferation)) '())
```

TRUE. Your statement is correct:

```
(cause
  (p15 cell-proliferation)
  (("inferred_from"
    cause
    (p15 changes-in-gene-expression)
    (("inferred_from"
      cause
      (p15 rb)
      (("inferred_from" block
                        (p15 cyclin-d:cdk4)
                        tgfb-context
                        block
                        (cyclin-d:cdk4 rb)
                        tgfb-context))
      cause
      (rb changes-in-gene-expression)
      (("inferred_from" block
                        (rb e2fs)
                        tgfb-context
                        block
                        (e2fs changes-in-gene-expression)
                        tgfb-context))))
   cause
   (changes-in-gene-expression cell-proliferation)
   (("inferred_from" cause
                     (changes-in-gene-expression cyclin-e:cdk2)
